masked by cis interactions with sialic acids on the same cell surface. In the immune response, may act as an inhibitory receptor upon ligand induced tyrosine phosphorylation by recruiting cytoplasmic phosphatase(s) via their SH2 domain(s) that block signal transduction through dephosphorylation of signaling molecules. -1- FUNCTION: Putative adhesion molecule that mediates sialic-acid dependent binding to cells. Preferentially binds to alpha2,3- or 2,6-linked sialic acid. The sialic acid recognition site may be

SUBUNIT: Interacts with PTPN6/SHP-1 upon phosphorylation.
SUBCELLULAR LOCATION: Type I membrane protein (isoforms 1-4);
secreted (isoform 5).

(eosinophils, monocytes and natural killer cell subpopulation).

Isoform 5 is found to be the most abundant isoform. Pound in lymph node, lung, ovary and appendix. Isoform 1 is found at high levels and isoform 2 at lower levels in bone marrow, spleen and spinal chord. Isoform 2 is also found in brain. Isoform 4 is specifically cound in natural killer cells.

-!- DOMAN: Contains 1 copy of a cytoplasmic motif that is referred to as the immunoreceptor tyrosine-based inhibitor motif (ITIM). This motif is involved in modulation of cellular responses. The phosphorylated TIM modulation of cellular responses. The phosphorylation of Tyr-667 is involved in binding to PTPN6.
-!- PTM: Phosphorylation of Tyr-667 is involved in binding to PTPN6.
-!- PTM: Phosphorylation 3 immunoglobulin superfamily. SIGLBC (slalic acid binding Ig-like lectin) family.
-!- SIMILARITY: Contains 3 immunoglobulin-like C2-type domains.
-!- SIMILARITY: Contains 1 immunoglobulin-like V-type domains.

Genome Res. 13.265-2270(2003).
-! FUNCTION: Putative adhesion molecule that mediates sialic-acid dependent binding to cells. Preferentially binds to alpha2.8-
linked sialic acid. The sialic acid recognition site may be masked by cis interactions with sialic acids on the same cell surface. In the immune response, may act as an inhibitory receptor upon ligand induced tyrosine phosphorylation by recruiting cytoplasmic phosphorses(s) via their SNE domain(s) that block signal transduction through dephosphorylation of signaling molecules.
-! SUBUNIT: Interacts with PTPN6/SHP-1 and PTPN11/SHP-2 upon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      IsoId=096RL6-2; Sequence=VSP 008764;
-!- TISSUE SPECIFICITY: Expressed by macrophages in various tissues including Kupffer cells. Also found in brain microglia.
-!- DOWAIN: Contains I copy of cytoplasmic motif that is referred to as the immunoreceptor tyrosine-based inhibitor motif (ITIM). This motif is involved in modulation of cellular responses. The phosphorylated ITIM motif can bind the SH2 domain of several SH2-
                                                                      PTPN11.

```

- -!- FUNCTION: Putative adhesion molecule that mediates sialic-acid dependent binding to cells. Binds equally to alpha2,3-linked and alpha2,6-linked sialic acid. The sialic acid recognition site may be masked by cis interactions with sialic acids on the same cell surface.
- -!- SUBCELULIAR LOCATION: Type I membrane protein.
 -!- SUBCELULIAR LOCATION: Type I membrane protein.
 -!- TISSUE SPECIFICITY: Expressed by monocytic/myeloid lineage cells. Found at high levels in professed blood leukocytes, spleen, bone marrow and at lower levels in lymph node, lung, appendix, placenta, pancreas and thymus. Expressed by monocytes and neutrophils but absent from leukemic cell lines representing early stages of myelomonocytic differenciation.
 -!- DOMAIN: Contains 1 copy of a cytoplasmic motif that is referred to as the immunoreceptor tyrosine-based inhibitor motif (ITIM). This motif is involved in modulation of cellular responses. The phosphorylated ITIM motif can bind the SH2 domain of several SH2-

This SWISS-PROT entry is copyright. It is produced through a collaboration between the Swiss Institute of Bioinformatics and the EMB contestation the Buropean Bioinformatics Institute. --- SIMILARITY: Belongs to the immunoglobulin superfamily. SIGLEC (stallic acid binding 1g-like lectin) family.
--- SIMILARITY: Contains 3 immunoglobulin-like C2-type domains.
--- SIMILARITY: Contains 1 immunoglobulin-like V-type domains.

Biol. Chem. 276:45128-45136 (2001).

Provident binding to cells. Preferentially binds to alpha2.3-
linked stalic acid. The stalic acid recognition site may be masked by cis interactions with stalic acids on the same cell surface.

SUBCELULLAR LOCATION: Type I membrane protein.

TISSUE SPECIFICITY: Predominantly expressed by immature monocytic/myeloid lineage cells in bone marrow. Also found at lower levels in mature neutrophils and monocytes.

DOMAIN: Contains I copy of a cytoplasmic motif that is referred to as the immunoreceptor tyrosine-based inhibitor motif (ITIM). This

Submitted (OCT-2000) to the EMBL/GenBank/DDBJ databases.

-I FUNCTION: Putative adhesion molecule that mediates sialic-acid dependent binding to cells. Preferentially binds to adhas, 3-

Innked sialic acid. Also binds to alpha2,6-linked sialic acid.

sialic acid recognition site may be masked by cis interactions with sialic acids on the same cell surface.

-I SUBCELDULAR LOCATION: Type I membrane protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi,

In SPECIFICITY: The short Isoform is highly expressed in spleen, small intestine and adrenal gland; it is lower expressed in thyroid, placenta, brain, stomach, bone marow, spinal chord and beast. The long isoform is highly expressed in spleen, small intestine marrow; it is lower expressed in thyroid, placenta, thymus, trachea, stomach, lung, adrenal gland, fetal brain and teetis.

                                                                                                                                                                    DOMAIN: Contains 1 copy of a cytoplasmic motif that is referred to
as the immunoreceptor tyrosine-based inhibitor motif (ITIM). This
motif is involved in modulation of cellular responses. The
phosphorylated ITIM motif can bind the SH2 domain of several SH2-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sialic acid binding Ig-like lectin-like
                                                                                                                                                                                                                                  containing phosphatases.
SIMILARITY: Belongs to the immunoglobulin superfamily. SIGLEC (siallic acid binding Ig-like lectin) family.
SIMILARITY: Contains 2 immunoglobulin-like C2-type domains.
SIMILARITY: Contains 2 immunoglobulin-like V-type domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               (Potential).

                                                                                -1. SUBCELLULAR LOCATION: Type I membrane protein.
-1. DOMAIN: Contains I copy of a cytoplasmic motif that is referred to as the immunoreceptor tyrosine-based inhibitor motif (ITIM). This motif is involved in modulation of cellular responses. The phosphorylated frum motif can bind the SH2 domain of several SH2-containing phosphases to the immunoglobulin superfamily. SIGLEC (stail can bind the SH2) family. SIGLEC (stail can bind in graph family graph family graph family graph family graph family family. SIGLEC (stail binding 1g-like lectin) family.
-1. SIMILARITY: Contains 2 immunoglobulin-like V-type domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         TTKGAPVATNHQSREVEMSTRGRFQLTGDPAKGNCSLVIRDAQMQDESQYFFRVERGSYV

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Potential.
Sialic acid binding Ig-like lectin-like
     Mod. Chem. 276:40282-40287(2001).
FUNCTION: Putantive adhesion molecule that mediates sialic-acid dependent binding to cells. The sialic acid recognition site may be masked by cis interactions with sialic acids on the same cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                      InterPro; IPR07110; Ig-like.

COMPUTER: IBM Compatible
OPENATING SYSTEM: DOS
SOFTWARE: FastSED for Windows Version 2.0
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/09/046,736
FILING DATE: 24-MAR-1998
CLASSIFICATION: 514
PRIOR APPLICATION DATA:
APPLICATION NUMBER: 60/041,885
FILING DATE: 02-APR-1997
ATTORNEY/AGENT INFORMATION:
                                                    LENGTH: 431 maino acids

TYPE: amino acid

STRANDEDNESS: single

TOPOLOGY: linear

MOLECULE TYPE: protein

US-09-038-832-4

```
This is the amino acid sequence of new human sialoadhesin family 4 (SAF-4), as deduced from the nucleotide sequence of an isolated cDNA clone (see AAV99911). SAF-4 polynucleotides and polypeptides, and methods for producing such polypeptides in transformed host cells using recombinant techniques are disclosed. SAF-4, its agonists and antagonists, and nucleat acid molecules that enhance or inhibit SAF-4 expression, may be used to treat patients in need of enhancement or inhibition of SAF-4
                                                                                                                                                       SAF-4; staloadhesin family; human, therapy; diagnosis; cancer; inflammation; autoimmune disease; allergy; asthma; inflammation; cerebellar degeneration; Alzheimer's disease; Parkinson's disease; multiple sclerosis, amyotrophic lateral sclerosis; head injury; septic shock; sepsis; stroke; osteoporosis; osteoparthritis; lischemia reperfusion injury; cardiovascular disease; kidney disease; liver disease; myocardial infarction; hypotension; hypertension; AIDS; myelodysplastic syndrome; aplastic anaemia; baldness; infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New sialoadhesin family 4 polypetides and polynucleotides treat various diseases associated with SAF-4 expression.
                                                                                                                      Human sialoadhesin family 4 (SAF-1) polypeptide.

Claim 9; Page 89-91; 92pp; English

This sequence is a human obesity protein binding protein-2 homologue (hobbe used for the manufacture of a medicament for the treatment of obesity and/or obesity-related disorders. The hob-BP2h nucleic acids are useful as probes or amplification primers in the detection, quantification or isolation of gene sequences or transcripts, for recombinant expression of hob-BP2h polypeptides, as immunogens in the preparation and screening of antibodies, and in sense or antisense suppression of one or more hob-BP2h antiponic epitope-bearing peptides and of one or more hob-BP2h Antigenic epitope-bearing peptides and oplypeptides are useful for a singing of screening antibodies that specifically binds to the hob-BP2h 120 120 180 180 240 240 300 9 9 ERGSYVRYNFWNDGFFLKVTVLSFTPRPQDHNTDLTCHVDFSRKGVSAQRTVRLRVAYAP LENLGNGTSLPVLEGQSLCLVCVTHSSPPARLSWTQRGQVLSPSQPSDPGVLELPRVQVE LENLGNGTSLPVLEGGSLCLVCVTHSSPPARLSWTQRGQVLSPSQPSDPGVLELPRVQVE FKAVTETTKGAPVATNHQSREVEMSTRGRFQLTGDPAKGNCSLVIRDAQMQDESQYFFRV ERGSYVRYNFMNDGFFLKVTVLSFTPRPQDHNTDLTCHVDFSRKGVSAQRTVRLRVAYAP HPWGPRPLGLELPGVKAGDSGRYTCRAENRLGSQQRALDLSVQYPPENLRVMVSQANRTV 1 MLLPLLLSSLLGGSQAMDGRFWIRVQESVMVPEGLCISVPCSFSYPRQDWTGSTPAYGYW 1 MLLPLLLSSLLGGSQAMDGRFWIRVQESVMVPEGLCISVPCSFSYPRQDWTGSTPAYGYW RDLVISISRDNTPALEPQPQGNVPYLEAQKGQFLRLLCAADSQPPATLSWVLQNRVLSSS 181 RDLVISISRDNTPALEPQPQGNVPYLEAQKGQFLRLLCAADSQPPATLSWVLQNRVLSSS 241 HPWGPRPLGLELPGVKAGDSGRYTCRAENRLGSQQRALDLSVQYPPENLRVMVSQANRTV FKAVTETTKGAPVATNHQSREVEMSTRGRFQLTGDPAKGNCSLVIRDAQMQDESQYFFRV Gaps 0: Length 639; Indels 100.0%; Score 3377; DB 3; 100.0%; Pred. The present invention relates to 12 secreted human proteins and the nucleotide sequences encoding them. The polynucleotide sequences given in AAA80606-A80623 encode the 12 secreted protein sequences given in AA825576-B25593. The human secreted proteins have various activities dependent on the tissues in which they are expressed. Examples of the activities of the proteins include: immunosuppressant; anti-inflammatory, antiarthritic; antirheumatic, dermatological; antiproliferative; antiarteriosclerotic; anticoncer, vulnerary, antivital; antibacterial; and antifungal activity. The proteins, polypeptides, agonists and

New human secreted nucleic acid molecules and polypeptides, useful for preventing, treating, or ameliorating a medical condition, such as cancer, inflammation, immune disorders, neurological and blood clotting disorders.

Claim 11; Fig 13; 454pp; English.

The invention relates to an isolated nucleic molecule that is at least 55% identical to 19 human cDNA sequences representing 12 novel genes 50% identical to 19 human cDNA sequences representing 12 novel genes 50% identical to 19 human cDNA sequences representing 12 novel genes 50% identical sequence contained in American Type Culture Collection (ATCC) deposit No. defined in the specification, its species homologue, a variant or allelic correction of the polymoclectide having a polymuclectide having a polymuclectide having a polymuclectide are the polymoclectide are compinant vectors, host cells (for producing the polypeptide), the recombinant vectors, host cells (for producing the polypeptide), the secreted polypeptide (comprising a sequence that is at least 95% incention to a polypeptide (for producing the polypeptide), antibodies that secreted polypeptide (for producing the polypeptide), antibodies that content variant, allelic variant or species homologue), antibodies that spretchin variant, allelic variant or species homologue), antibodies that spretchin and to the polypeptides, diagnosing, treating, preventing or ameliorating a medical condition by administering the polypeptides are sequence in a cell, isolating the supernatant, and detecting an activity in a biological sasay and identifying the protein in the supernatant of naving the activity). The polypeptides, nucleic acids and antibodies are cuseful for diagnosing a pathological condition or a susceptibility to a pathological condition, for preventing, treating, or ameliorating a pathological condition and other immune content and pathological and blood clotting disorders (many examples are disorders, neurological and blood clotting disorders (many examples are disorders, neurological and blood clotting disorders (many polypeptides and antibodies are also useful for chromosome identification). The molypeptides and antibodies are useful for chromosome identification, radiation hybrid mapping are useful for tissues immunobistochemistry assays. The polyp

The invention relates to an isolated SIGLEC (sialic acid-binding Igrelated lectin) protein [1]. Pharmaceutical compositions comprising [1] are useful for treating immune system diseases such as asthma, leukaemia or other allergic or inflammatory diseases such as asthma, leukaemia or or other allergic or inflammatory diseases. Extracellular domains of [1] represent potential markers for screening, disquosis, prognosis, follow up assays, and imaging methods. [1] is useful as a target for drugs which inflammation, tissue damage and remodeling in asthma, and inflammation tissue as allergic rhinitis, osteoarthritis, crohn's disease, psoriasis, rheumatoid arthritis, conjunctivitis, etc. [1] is also useful for monitoring the course of disease or disorders, and for identifying agents that bind with and/or modulate the biological activity of SIGLEC-BMS proteins. The nucleic acid molecules [1] encoding [1] are useful in diagnosis and/or prognosis methods, and to detect the presence and/or amount of SIGLEC-BMS nucleocids sequences and/or SIGLEC-BMS proteins in a biological sample. [11] are useful as nucleic acid probes are useful for screening genomic library to isolate a genomic clone of SIGLEC-BMS antibodies are also used to detect or isolate cells. The SIGLEC-BMS antibodies are also used to detect, sort or isolate cells

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated nucleic acid sequence, or its allelic variant, a fragment of the cDNA sequence, or its fragment, domain, epitope or species homologue. The nucleic acid is useful for preparing a medicament for preventing, treating or ameliorating a medical condition e.g., cancer, liver disorders such as hepatitis or neural disorders such as Alzheimer's disease. The present sequence represents the amino acid sequence of a novel human secreted protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  120

The invention relates to an isolated nucleic molecule that is at least SX TA The invention relates to an isolated nucleic molecule that is at least CC 54 identical to 18 human CDNA sequences representing 12 novel genes encoding secreted proteins or a polymucleotide fragment of the CDNA contained in American Type Culture Collection (ATC) deposit No. defined in the specification, its species homologue, a variant or allelic variant of the polymucleotide having a polymucleotide agabale of hybridise under stringent conditions to a mucleic acid molecule des not hybridise under stringent conditions to a mucleic acid molecule combinant vectors, host cells (for producing the polymeptide), the secreted polymeptide (comprising a sequence of only A or T residues. Also included are secreted polymeptide fragment, domain, epitope, full-length protein, variant, allelic variant or species homologue), antibodies that secreted polymeptide fragment, domain, epitope, full-length protein, variant, allelic variant or species homologue), antibodies that specifically bind to the polymeptides, diagnosing, treating, preventing or ameliorating a medical condition by administering the polymenting or ameliorating an activity in a biological assay (by expressing the CDNA sequence and a biological assay and identifying the protein in the supernatant, and detecting an activity in a biological assay (by expressing the CC identifying an activity). The polymeptides, mucleic acids and antibodies are useful for diagnosing a pathological condition, such as cancer, inflammation and other immune activity, and polymeptides, mucleic acids and antibodies are useful for diagnosing apathological condition, such as cancer, inflammation and other immune disorders, neurological and blood clotting disorders (many examples are restriction mapping). The polymeptides are also useful for chromosome identification). The mucleic acids are also useful for chromosome identification, radiation hybrid mapping or long-range restriction apping the polymeptides are also ob
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New human secreted nucleic acid molecules and polypeptides, useful for preventing, treating, or ameliorating a medical condition, such as cancer, inflammation, immune disorders, neurological and blood clotting

```
The present invention describes human cell surface protein with changolobulin folds, designated 856-19 (i). (I) has cytocatatic, communication describes human corp. antidiabetic and darmatological activities and can be used in gene cartification and dermatological activities and can be used in gene therapy. (I) can be used for preventing treating or ameliorating a medical condition, such as a disorder related to aberrant immunoglobulin receptor activity; adsorder; adisorder related to hyper- or hypo-lamunoglobulin receptor activity; adsorder; calacted to aberrant signal transduction; ar expendentive disorder; adisorder; related to hyper- or hypo-lamunoglobulin receptor activity; adisorder; an ovarian disorder; ovarian cancer; calacted to aberrant signal transduction; otherwise menopause; placemati dysfunction; infertility; pelyic inflammatory disease; candometricis; placental aroundates deficiency; premature menopause; placemati dysfunction; infertility; pelyic inflammatory disease; candometricis; incomplete isosexual precocity; premature showing of cender placematic premature puberty; percections; premature stowing of cendermatoric premature puberty; premature thelarch; premature puberty; premature thelarch; premature puberty; premature thelarch; premature puberty; premature thelarch; premature puberty; premature thelarch; premature puberty; premature thelarch; premature puberty; premature thelarch; premature puberty; premature thelarch; premature puberty; premature thelarch; premature puberty; premature thelarch; premature puberty; premature thelarch; premature puberty; premature thelarch; premature dysmenorrhoa; polymenorrhoa; polycytic oversus of inclammatory disorders; asthm; immune transplanted organs and tissues; such as high sorders; athmitis; granning and premature thelarch; protections to transplanted organs and tissues; such as high sorders; and premature infertility; adjoined and premature the special stored premature infertility; allomerulonpathics; such as T-cell medical cupical proposers; Musture
                                                                                                                                                                                                                                          New isolated nucleic acid molecule encoding BGS-19 polypeptides, useful for preventing, treating or ameliorating a medical condition, such as a disorder related to aberrant immunoglobulin cell surface receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1 MLLPLLLSSLLGGSQAMDGRFWIRVQESVMVPEGLCISVPCSFSYPRQDWTGSTPAYGYW

in the formation, differentiation and maintenance of multicellular corganisms. The fate of many individual cells (for example proliferation, or organisms. The fate of many individual cells (for example proliferation, migration or differentiation) is typically governed by information. The cells and the immediate environment. The information is often transmitted by secreted polypeptides (for example mitogenic factors, auryival factors, cytocoxic factors, differentiation factors, neuropeptides and hormones) which are received and interpreted by diverse cell receptors may be of use as pharmaceutical and diagnostic agents, such as in the blocking of receptor-ligand interpreted by diverse and receptors may be of use as pharmaceutical and diagnostic agents, such as in the blocking of receptor-ligand interactions. The current invention provides the amino acid sequences of novel human membrane bound receptors and proteins of the invention may have cytostatic activities through the stimulation of chondrocytes. The nucleic acids of the invention may be useful for the manufacture of a medicament for diagnosing or treating at tumour in a mammal. In addition, they may be useful for measuring or detecting the expression of a tumour associated gene. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             242
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             542

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to PRO proteins and their coding sequences.

The PRO proteins are useful for diagnosing and treating a B cell related disorder, e.g. X-linked infantile hypogammaglobulinemia, polyaacdaride antigen unresponsiveness, selective 19A deficiency, selective IgM proteince of the proteince of the proteince of the proteince of the proteince of the proteince of the protein in the protein protein in the protein protein in the protein in the protein in the protein in the protein in the protein in the protein in the protein in the protein in the protein in the protein in the protein in the protein in the protein in the development of the protein in the protein in the protein in the development of the protein in the development of the protein in the development of animals or knockout animals, which in turn are useful in the development and screening of therapeutically useful reagents.
New PRO polypeptide, useful for diagnosing and treating a B cell related disorder, e.g. Burkitt's lymphoma, rheumatoid arthritis, autoimmune mediated hemolytic anemia, myasthenia gravis or ankylosing spondylitis.
                                                                                                                                                                                                                              Immunosuppressive, Cytostatic, Antiarthritic, Antirheumatic, Antianemic, Antiale Ergic, Muscular, Neuroprotective, Nephrotropic, Antiinfiammatory, Gene Therapy, PRO, B cell related disorder, cancer; immune-mediated inflammatory disease, human.

WPI; 2002-241565/29. N-PSDB; ABK43361 Novel isolated SIGLEC (sialic acid-binding Ig-related lectin) protein molecules useful for treating immune system diseases such as asthma, leukemia, allergic rhinitis, psoriasis, conjunctivitis, Crohn's disease.

Claim 5; Fig 3B; 209pp; English.

The Invention Feates to an isolated style. Feater compositions comprising (I) are useful for treating immune system diseases such as asthma, leukaemia or other allergic or inflammatory diseases. Extracellular domains of (I) represent potential markers for screening, diagnosis, prognosis, follow up assays, and imaging methods. (I) is useful as a target for drugs which inflammation, tissue damage and remodeling in asthma, and inflammatory diseases such as allergic rhinitis, osteoarthritis, Crohn's disease, psoriasis, rheumatoid arthritis, conjunctivitis, etc. (I) is also useful for monitoring the course of disease or disorders, and for identifying agents that bind with and/or modulate the biological activity of SIGLEC-BMS proteins. The nucleic acid molecules (II) encoding (I) are useful in diagnosis and/or prognosis methods, and to detect the presence and/or amount of SIGLEC-BMS uncleoside sequences and/or SIGLEC-BMS proteins and/or prognosis methods, and to detect the presence and/or amount of SIGLEC-BMS uncleoside sequences and/or signification of SIGLEC-BMS suchedial sample. (II) are useful as nucleic acid probes are useful for screening genomic library to isolate a genomic clone of SIGLEC gene. SIGLEC-BMS gene copy number is determined for detecting diseases or disorders associated with SIGLEC-BMS transcripts or proteins. The SIGLEC-BMS sutilodies are also used to detect, sont or isolate evels expressing SIGLEC-BMS proteeins and in diagnostic imaging technology. ABURG7074-AAU87089 represent human SIGLEC amino acid sequences of the The invention relates to an isolated SIGLEC (sialic acid-binding Ignvention ្នុងXង្គឹម្ពងក្នុងដើម្បីម៉ូស៊ីនិស្សកិច្ចិក្រពីពិភិបិតិ គឺគឺគឺគឺកិច្ចិក្ខិតិ ក្នុងក្នុងក្នុងក្នុងក្នុងក្នុង គឺ ក្នុង

(HUMA-) HUMAN GENOME SCI INC

Rosen CA, Ruben SM;

WPI: 2003-533050/50. N-PSDB; ADD19239 New isolated nucleic acids encoding signal transduction pathway component polypeptides, useful for diagnosing, treating, and/or preventing disorders, such as cancer, infections, cardiovascular and inflammatory diseases

Claim 11; SEQ ID NO 141; 554pp; English

The invention relates to an isolated nucleic acid molecule (CDNA)

concoding a human secreted protein, representing one of 85 novel genes.

Also included are recombinant vectors, host cells (expressing the protein), the secreted proteins (including their fragments, epitopes and homologues), an isolated antibody that binds specifically to the protein, diagnosing a pathological condition or susceptibility to a pathological condition based on the presence of a mutation in the nucleic acid and diagnosing a condition based on the presence or absence of the mutation), diagnosing a pathological condition or susceptibility to a pathological condition (comprising determining the protein in a biological sample presence or amount of expression of the protein in a biological sample or and diagnosing a condition based on the presence or amount of expression of the protein in a biological condition of the protein in a biological sample of the protein to a mammalian subject, by administering the nucleic acid or protein to a mammalian subject, identifying a binding partner to the protein, the gene corresponding to the cDNA sequence, and identifying an activity in a biological assay (comprising expressing the nucleic acid in a cell, isolating the

supernatant, detecting an activity in a biological assay and identifying the protein in the supernatant having the activity). The nucleic acids and proteins display the following activities Cytostatic, antibacterial, Virucide, Neuroprotective, Gynaecological, Gastrointestinal-Gen, Cardiant, Gardiovascular-Gen, Nephrotropic, Antihilamatory, Muscular-Gen, Respiratory-Gen, Immunosuppressive, Carebroprotective, Vasotropic, Nootropic, Antialiargic. The methods and compositions of the present invention are useful for diagnosing, treating, preventing and/or prognosticating disorders related to the novel polypeptides, such as cancer, bacterial or viral infections, and neural, immune system, blood, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, remal, inflammatory or proliferative disorders (many examples of these diseases and disorders are given in the specification). The present sequence represents a novel secreted protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                             VSLSLSVHYSPKLLGPSCSWEAEGLHCSCSSQASPAPSLRWWLGEELLEGNSSQDSFEVT

RESULT 13 AAU87074 ID AAU87

```
The invention relates to an isolated SIGLEC (sialic acid-binding Igrelated lectin) protein (I). Pharmaceutical compositions comprising of are useful for treating immune system diseases such as asthma, leukaemia or other allergic or inflammatory diseases. Extracellular domains of (I) represent potential markers for screening, diagnosis, prognosis, following passays, and imaging methods. (I) is useful as a target for drugs which inhibit inflammation, tissue damage and remodeling in asthma, and inflammatory diseases such as allergic thinitis, osteoarthritis, crohn's disease, psoriasis, rheumatorid arthritis, conjunctivitis, etc. (I) is also useful for monitoring the course of disease or disorders, and for identifying agents that bind with and/or modulate the biological activity of SIGLEC-BMS proteins. The nucleic acid molecules (II) encoding (I) are useful in diagnosis and/or prognosis methods, and to detect the presence and/or amount of SIGLEC-BMS nucleotide sequences and/or SIGLEC-BMS proteins in a biological sample. (II) are useful as nucleic acid probes are useful for screening genomic library to isolate a genomic clone of signed cap and secreting diseases or disorders associated with SIGLEC-BMS transcripts or proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The SIGLEC-BWG antibodies are also used to detect, sort of isolate cells expressing SIGLEC-BWS proteins and in diagnostic imaging technology. The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated include blood accordant and callular adhesion disorders. They may also be used to raise antibodies, AAZ31891 to AAZ34388, and AAY41685 to AAY41774 represent polynucleotide and polypeptide sequence given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        FKAVTETTKGAPVATNHQSREVEMSTRGRFQLTGDPAKGNCSLVIRDAQMQDESQYFFRV 120

AAC78458 to AAC78599 represent polynucleotide and EST (expressed sequence tag) sequences which encode secreted or transmembrane PRO polypeptides. The PRO polynucleotides and polypeptides have cytostatic activity. The polynucleotides and polypeptides can be used for detecting the presence of PRO polypeptides in samples, for linking bicactive molecules to cells and for modulating biclogical activities of cells, using the polypeptides for specific targeting. The polypeptide targeting can be used to kill the target cells, e.g. for the treatment of cancers. The polypeptide provide specific targeting of bicactive molecules to cells. AAC78600 to AAC78897 represent PCR primers and probes used in the isolation of the PRO polynucleotide sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel PRO polypeptides and polynucleotides used in detection methods, target bioactive molecules to specific cells, and to modulate cellular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         I, Gerritsen ME;

t C New sialoadhesin family 4 polypetides and polynucleotides - useful treat various diseases associated with SAF-4 expression.

Claim 1; Page 31; 48pp; English.

This is the amino acid sequence of new human sialoadhesin family 4 (SAF-4), as deduced from the nucleotide sequence of an isolated cDNA clone (see AAV99911). SAF-4 polynucleotides and polypetides, and methods for producing such polypetides in transformed host cells using recombinant techniques are disclosed. SAF-4, its agonists and antagonists, and nucleic acid molecules that enhance or inhibit SAF-4 expression, may be used to treat patients in need of enhancement or inhibition of SAF-4

expression or activity. Conditions that may benefit from such treatment archaet cancer, inflammation, autocimmunity, allergy, asthma, rheumatoid archaettis, CNS inflammation, cerebellar degeneration, Althelmer's disease, Parkinson's disease, multiple sclerosis, amyotrophic lateral sclerosis, head injury damage and other neurological disorders, septic shock, sepsis, stroke, osteoporosis, osteoarthrifs, isofemmia reperfusion injury, cardiovascular disease, kidney disease, liver disease, isohemic injury, myocardial infarction, hypotension, hypertension, AlDS, myelodysplastic syndromes and other heematologic abnormalities, aplastic anaemia, male baldness pattern and bacterial, protozoal, fungal and viral infections related to SAF-4 polypeptide activity. Methods of identifying agonistic assays for detecting diseases associated with inappropriate SAF-4 activity or levels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                540

This sequence is a human obesity protein binding protein-2 homologue (hobbensh) of the invention. The hOB-BP2h nucleic acids and polypeptides may be used for the manufacture of a medicament for the treatment of obesity and/or obesity-related disorders. The hOB-BP2h nucleic acids are useful as probes or amplification primers in the detection, quantification or isolation of gene sequences or transcripts, for recombinant expression of hOB-BP2h polypeptides, as immunogens in the preparation and screening of antibodies, and in sense or antisense suppression of one or more hOB-BP2h antibodies and in sense or antisense suppression of one or more hOB-BP2h Antigenic epitope-bearing peptides and polypeptides are useful for raising or screening antibodies that specifically binds to the hOB-BP2h
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ERGSYVRYNFMNDGFFLKVTVLSFTPRPQDHNTDLTCHVDFSRKGVSAQRTVRLRVAYAP

New sialoadhesin family 4 polypetides and polynucleotides - useful treat various diseases associated with SAF-4 expression.

Claim 13; Page 31-32; 48pp; English.

This is the nuclectide sequence of an expressed sequence tag (EST) clone that encodes a polypeptide (see AAM81024) which shows close homology and/or structural similarity (e.g. a conservative amino acid difference) to new human slanladather family 4 (SAF-4) polypeptide (see AAW81023). SAF-4 polynuclectides and polypeptides, and methods for producing such polypeptides in transformed host cells using recombinant techniques, are disclosed. SAF-4, its agonists and artagonists, and nucled acid antended that enhance or inhibit SAF-4 expression, may be used to treat patients in need of enhancement or inhibit ton of SAF-4 expression or activity. Conditions that may benefit from such treatment include cancer, inflammation, cerebellar degeneration, Alzehimer's disease, Parkinson's clinifarmation, autoimmunity, allergy, asthma, richamatoid arthritis, CNS inflammation, cerebellar degeneration, Alzehimer's disease, Parkinson's disease, wultiple sclerosis, amyotrophic lateral sclerosis, head injury damage and other neurological disorders, septic shock, sepsis, stroke, osteoporosis, osteobarthritis, ischemia reperfusion injury, myocardial inflatoriton, hypoentanison, AIDS, myelodypalatic syndam, ame balaness pattern and bacterial, protozoal, fungal and viral inflections related to safe-4 polypeptide activity. Methods of identifying agonists, safety or antagonists/inhibitors are also provided, as well as diagnostic assays for electing diseases associated with inappropriate SAF-4 activity or antagonists or antagonists or antagonists or antagonists or antagonist

This cDNA clone codes for new human stalcadhesin family 4 (SAF-4)
polypeptide (See AAM81023). It can be obtained e.g. from a CDNA library
carived from mRNA in cells of human primary dendritic cells, using
expressed sequence tag analysis. SAP-4 polymocleotides and polypeptides
and methods for producing such polypeptides by recombinant techniques are
and methods for producing such polypeptides by and mucleic acid
acidsclosed. SAF-4, its agonists and antegonists, and mucleic acid
molecules that enhance or inhibit SAF-4 expression, may be used to treat
patients in need of enhancement or inhibition of SAF-4 expression or
carivity. Conditions that may benefit from such treatment include cancer,
inflammation, autoimmunity, allergy, atthma, rheumatoid arthritis. CNS
inflammation, cereballar degeneration, Alzheimer's disease, head injury
damage and other neurological disorders, septic shock, sepsis, stroke,
disease, miltiple solerosis, amyorders, septics shock, sepsis, stroke,
disease, kidney disease, liver disease, ischemia reperfusion injury, cardiovascular
disease, kidney disease, liver disease, ischemic injury, myocardial
infarction, hypotension, hypertension, AlDS, myelodysplastic syndiess
con other haematologic abnormalities, achemic mademia, male baldness
contended the pathods of identifying agonists,
she hypotension, and servivery Methods of identifying agonists,
she hypotension, and servivery methods, as well as diagnostic assays
for detecting diseases associated with inappropriate SAF-4 activity or ö TTCTGGATACGAGTGCAGGAGTCAGTGATGGTGCCGGAGGGCCTGTGCATCTCTGTGCCC 120 septic shock, sepsis, stroke, osteoporosis, osteoarthritis, ischemia reperfusion injury; cardiovascular disease, kidney disease, liver disease, myocardial infarction; hypotension; hypertension; AIDS, myelodysplastic syndrome; aplastic anaemia; baldness; infection; ss. New sialcachesin family 4 polypetides and polynucleotides - useful to treat various diseases associated with SAF-4 expression.
